

ABSTRACT OF THE DISCLOSURE

A heat pipe includes a tubular body, a heat transfer fluid, and a heat sink member. The tubular body has opposite bottom and top ends, a peripheral wall between
5 the bottom and top ends, and an inner chamber defined by the bottom and top ends and the peripheral wall for receiving the fluid therewithin. The heat sink member has a bottom face adapted to contact a heat source, and a top face indented downwardly to define a fluid
10 accumulating portion. The fluid in the fluid accumulating portion absorbs heat from the heat source and vaporizes to carry heat away from the heat source.
